

### Task 3

You have to create two databases (student and teacher) in your database server. You have to store basic information about students & teachers in respective databases. You have to fetch the student name from the student database and teacher name from the teacher database and then print names in the console.

Hint: Create multi connection database.

Note: API <http://localhost:3000/api/upcloud/users/>

Steps to execute

Npm init

Node index.js

Call get api through the file to get the data.

Data will be printed in console from both the database
